

Development of KR-EEIO & GHG-Simulator

Young-Ho Jung, Ga-Hyun Choi
August 12, 2026

All views and data presented herein are the authors' own personal research and do not reflect the official position or statistics of the Bank of Korea.

Content

1. KR-EEIO(Korean Environmentally-Extended Input-Output)
 - 1.1. Overview
 - 1.2. Estimation of GHG by industry
 - 1.3 IOTs at constant price
2. Pipeline of GHG Inducement Coefficient Calculation
 - 2.1 Scope 1·2·3 Decomposition Logic
3. Aanlysis Results and Model Hub Upload
4. GHG-Simulator
5. Summary and Future Tasks

1.1 Overview

Environmentally Extended Input-Output (EEIO)

- Sub-item of UN's System of Environmental-Economic Accounting(SEEA)
 - o Compiled by combining environmental statistics(GHG, energy, water) and IOTs (GHG only in KR-EEIO)
- Basic data for environmental and climate-related analysis
- Enables Scope3 calculation by measuring indirect emissions
- Provides industry-average coefficients for rough calculations for SMEs that have difficulty measuring direct GHG emissions (serves as baseline data for GHG-Simulator)

1.1 Overview

T mat GHG(Total Table, incl. GHG)

Products	products	Agriculture	Manufacturing	Services	FD	Total Demand	Total Output	Imports
Agriculture		Intermediate Input						
Manufacturing								
Services								
VA		VA by Industry						
Total Input		Total Input by Industry						
GHG(t co2eq)		GHG by Industry						

- Same format as a standard IO table, but adds a GHG emissions (t CO2eq) row at the bottom, calculated via the estimation of GHG emissions by Industry
- Target year : 2015, 2020~2023
- Industry Sectors : Integrated Large Classification(33 Sectors)
- Prices : Current and Constant prices

1.1 Overview

Components

Items	Variable Name	Description
Total table	T_mat_GHG	IO Table (Import + Domestic) and emissions by industry
Input(GHG) coefficient	Ad	Emissions per unit of output (KRW million)
Production Inducement Coefficient	Lf	Total industry output induced by final demand (KRW million) for a specific product
Emission Inducement Coefficient	M	Total industry emissions induced by final demand (KRW million) for a specific product
Emissions by Final Demand Item	M-fd	Total emissions induced by each final demand item
Emissions based on Production Value	M·X(diag)	Total industry emissions induced by the production value of a specific product
Emission Scope	Scopes 1, 2, 3	Direct/Indirect emission classification
Import Transactions Table	I_mat	IO Table (Import)
Domestic Transactions Table	D_mat	IO Table (Domestic)

- Calculated using GHG by industry and IOTs, produced in both current and constant prices

1.2 Estimation of GHG Emissions by Industry

Basic Data

- National Inventory Report(NIR, 7 GHGs)
- Extended Energy Balance(EEB)
- IOTs(Current price published by Input-Output Team, Constant price additionally compiled)

Compilation procedure

- ① Match the industry classification of NIR and IOTs
- ② Calculate GHG emission by energy source using EEB
- ③ Allocate emissions calculated in step2 by industry using IOTs

1.2 Estimation of GHG Emissions by Industry

① NIR and IOTs Industry Classification Matching

<GHG Inventory>
(kt co2eq)

Sector / Category / Year	2023	
Total Emissions	707,199.78	
Net Emissions	667,766.58	
1. Energy	544,988.30	
A. Fuel Combustion	541,746.31	
1. Energy Industries	248,155.39

2. Oil and Natural Gas	907.96	B

- One-to-one matching : No additional work required
- One-to-many matching : Additional work (using EEB) required (total 4 items)

Allocate by industry via CO2-equivalent calculated by energy source

Calculate CO2-equivalent by energy source, then allocate by industry using the industry-linkage table

1.2 Estimation of GHG Emissions by Industry

② Calculating GHG Emissions by Energy Source Using the Extended Energy Balance

- For each energy source, multiply calorific value(TJ) x carbon coefficient x CO2 conversion factor(44/12) to calculate the CO2-equivalent amount, then match with the IO code

< CO2-Equivalent Calculation >

EEB(A)	Sector	2023															
		Domestic anthracite	Imported anthracite	Coking coal	Other bituminous coal	Sub-bituminous coal	Lignite	Peat	Solid fuel	Coke	Coal tar	Coke oven gas	Blast furnace gas	Other coal gas	Natural gas	City gas	Crude oil

1.2 Estimation of GHG Emissions by Industry

(A.c. Solid Fuel Manufacturing and Other Energy Industries)

- CO2-equivalent total is used as a ratio to allocate to B(Mining products), C04(Coal and petroleum products), D(Electricity, gas and steam)

<CO2-Equivalent for Industry Allocation Ratio>

IO code	Energy flow(2)(EEB)	Total CO2 equivalent
D	Gas manufacturing	-170,341.7
B	Coal mining	-44,773.3
B	Crude oil and natural gas extraction	0.0
C04	Briquette manufacturing_own consumption	0.0
D	Gas manufacturing_own consumption	-513,968.9
D	Synthetic coal gas manufacturing_own consumption	0.0
C04	Other conversion_own consumption	-1,137,941.7

	Total CO2 equivalent	Ratio	Distribution (NIR total)
			1590.37
B (Mining products)	44,773	2.4%	38.1
C04 (Coal and petroleum products)	1,137,942	60.9%	969.3
D (Electricity, gas and steam)	684,311	36.7%	582.9

1.2 Estimation of GHG Emissions by Industry

(A.2.g.8, Other, A.3.b. Road Transport, A.4.a. Commercial/Public)

- Allocate the calculated CO₂-equivalent amount using the industry-linkage table(380x33)

Total	IO Code	Fuel	A Agriculture, Forestry & Fisheries Products	B Mining Products	C01 Food & Beverage Products	C02 Textile & Leather Products	C03 Wood, Paper & Printing	C04 Coal & Petroleum Products	C05 Chemical Products	C06 Non-metallic Mineral Products	C07 Primary Metal Products	C08 Fabricated Metal Products	C09 Computer, Electronic & Optical Equipment	C10 Electrical Equipment	C11 Machinery & Equipment

1.3 Constant-Price Industry-Linkage Table

- Time-series analysis requires a constant-price industry-linkage table; in particular, constant-price output and the constant-price domestic transaction table are used to calculate various coefficients such as the GHG emission coefficient

2. Carbon Inducement Coefficient Calculation Pipeline

Core logic for carbon inducement coefficient calculation — Leontief model based on the domestic transaction table

1

Input Coefficient Matrix A

Divide the domestic transaction table Z by the total input vector X to quantify the domestic input structure between industries

$$A = Z / X$$

2

Leontief Inverse Matrix L

Derive the inverse matrix that captures all direct and indirect supply-chain ripple effects between industries

$$L = (I - A)^{-1}$$

3

Direct Emission Coefficient B

Unit emission coefficient obtained by dividing GHG emissions by industry (E, kt→t) by total input (X)

$$B = E / X$$

4

Supply-Chain Inducement Coefficient B×L

Multiply the direct emission coefficient by the Leontief inverse matrix to derive the total supply-chain inducement effect

$$BL = B \cdot L, \quad M = \text{diag}(B) \cdot L$$

* Before calculation, verify that the industry code order matches between the total and domestic transaction tables, and confirm the presence of the D(electricity) code

2.1 Scope 1·2·3 Decomposition Logic

Corrects for double-counting in the electricity (D) sector by splitting emissions into three scopes

Code logic (eeio_core_final.py)

```
scope_1 = B.copy()

scope_2_raw = M[D_row, :].copy()
scope_2_raw[D_row] -= scope_1[D_row]
scope_2 = max(scope_2_raw, 0)

scope_3_raw = BL - scope_1 - scope_2
scope_3 = max(scope_3_raw, 0)
```

Scope 1 Direct Emissions

= B (direct process/combustion emissions of the industry itself)

Scope 2 Indirect Energy Emissions

= electricity (D) row value of the M matrix – electricity's own direct emissions (extracts only the indirect portion induced through electricity consumption)

Scope 3 Indirect Supply-Chain Emissions

= $B \times L$ (supply-chain inducement coefficient) – Scope1 – Scope2 (remaining supply-chain induced portion from raw material/intermediate goods procurement, etc.)

* D_rel(electricity sector position): why its own direct emissions (B) are subtracted from the M-matrix row value — M[D,:] already includes electricity's own direct emissions, so they must be excluded to leave only the "indirect emissions induced by other industries consuming electricity."

3. Analysis Results and Model hub Upload

Scope Summary Dashboard

Korea Industry-Level Scope 1, 2, 3 Carbon Emissions Dashboard (2023, current prices)

All 33 industries | sorted by total emissions descending | Upstream/Downstream based on the M matrix

Korea Industry-wide Scope 1, 2, 3 Carbon Emissions Comprehensive Dashboard (2023, Current Prices)

All 32 industries | Sorted by total emissions in descending order | Upstream/Downstream based on carbon-induced (M matrix)

Comprehensive Insight – Carbon Emissions Structure Analysis Across All Industries

- The combined carbon footprint of all 32 industries is 1,612,503,745.6925 t CO₂eq, of which Scope 1 (Direct) accounts for 42.3%, Scope 2 (Energy) 24.5%, and Scope 3 (Supply chain) 33.2%.
- The top 3 industries by total emissions (Electricity, gas and steam; Primary metal products; Chemical products) account for 38.8% of the entire supply chain carbon footprint, indicating that emissions are concentrated in a small number of key industries.
- The industry with the highest Scope 1 share is 'Electricity, gas and steam' (81%), where managing direct emissions from processes and combustion is urgent, while the industry with the highest Scope 3 share is 'Construction' (76%), where supply chain management is key to carbon reduction.

- Aggregate carbon footprint and Scope 1/2/3 share across all industries · Concentration (share %) of the top 3 emitting industries
- Auto-highlight of the industry with the highest Scope 1/3 share · Narrative on the need for supply-chain decarbonization for industries with a high Scope 3 share

Scope Dashboard — Industry Detail Cards

#1 Electricity, Gas and Steam

Korea EEIO Analysis Results | 2023 Current Prices

Scope 1+2	Scope 1+2+3 (Total Emissions)
278,608,881.2666	283,078,134.7832

Unit: t CO₂eq / KRW million (current prices)

Top 5 Upstream (Actual emissions induced in other industries by this industry's production, t CO₂eq)

1. Chemical products	1,112,241.8048
2. Transportation services	1,009,692.4871
3. Primary metal products	796,758.9557
4. Coal and petroleum products	788,998.3113
5. Water supply, waste treatment and recycling services	285,531.1484

Top 5 Downstream (Actual emissions induced in other industries' production by this industry's emissions, t CO₂eq)

1. Chemical products	38,263,186.8123
2. Primary metal products	33,549,952.4902
3. Computer, electronic and optical equipment	28,398,737.1048
4. Transportation equipment	27,534,888.0051

Scope 1, 2, 3 Emissions Structure

Electricity, Gas and Steam

Scope 1 (81%)

Direct combustion and process emissions account for 81% of this industry's emissions.

Scope 2 (17%)

Indirect emissions from purchased electricity, gas, and steam use account for 17%.

Scope 3 (2%)

The remaining 2% is induced across the entire supply chain (raw materials, transportation, etc.).

* Approximate figures based on aggregated industry data, current prices

3. Analysis Results and Model hub Upload

Scope Dashboard — Industry Detail Cards

#5 Construction

Korea EEIO Analysis Results | 2023 Current Prices

Unit: t CO₂eq / KRW million (current prices)

Top 5 Upstream (Actual emissions induced in other industries by this industry's production, t CO₂eq)

1. Non-metallic mineral products	22,680,938.3685
2. Primary metal products	21,254,008.5085
3. Electricity, gas and steam	18,220,617.2171
4. Transportation services	7,473,435.8532
5. Chemical products	5,997,150.8339

Top 5 Downstream (Actual emissions induced in other industries' production by this industry's emissions, t CO₂eq)

1. Real estate services	104,150.2289
2. Wholesale, retail and commodity brokerage services	12,993.4767
3. Professional, scientific and technical services	11,324.5978
4. Restaurant and accommodation services	11,096.5886

Scope 1, 2, 3 Emissions Structure

Construction

Scope 1 (2%)

Direct combustion and process emissions account for 2% of this industry's emissions.

Scope 2 (22%)

Indirect emissions from purchased electricity, gas, and steam use account for 22%.

Scope 3 (76%)

The remaining 76% is induced across the entire supply chain (raw materials, transportation, etc.).

* Approximate figures based on aggregated industry data, current prices

3. Analysis Results and Model hub Upload

Direct Emissions(B) vs Total Emissions(B×L) Time Series

All industries (33) arranged in a 4-column grid, with both coefficients overlaid by year in each cell

How to Read the Chart

■ Blue line — direct emission coefficient (B)

■ Green line — supply-chain inducement coefficient (B×L)

Gap between the two lines = indirect induction via the supply chain (B×L – B)

A larger gap indicates an industry with higher supply-chain-driven emissions

Year axis: 2015, 2020~2023

3. Analysis Results and Model hub Upload

Direct Emissions(B) vs Total Emissions($B \times L$) Time Series

All industries (33) arranged in a 4-column grid, with both coefficients overlaid by year in each cell

Coal and Petroleum Products

- Current-price and constant-price patterns can be seen to differ
- After removing the price effect, the direct emission coefficient and the supply-chain inducement coefficient turn to an increasing trend
- In constant prices, the gap in indirect induction ($B \times L - B$) widens, showing markedly higher supply-chain-driven emissions

4. GHG-Simulator

- Enables SMEs and others to estimate total emissions and Scope 1·2·3 using KR-EEIO

Add company information to the already-compiled KR-EEIO(33x33)
(matching industry classification, 34x34)

- **Calculation pipeline**
 - $A \rightarrow L \rightarrow B \rightarrow B \times L$ calculation
 - Scope 1·2·3 decomposition logic (electricity double-counting correction)
 - Calculation logic and outputs of the corporate GHG-Simulator

4. GHG-Simulator

Enter a company's sales and cost structure to automatically estimate Scope 1-2-3 based on 2023 KR-EEIO (current price) data

STEP 1

Company Name

COMPANY_NAME

Used in the result file name

STEP 2

Industry Code

COMPANY_CODE

Select from the 33-industry code table
(e.g., C05 Chemical products)

STEP 3

Sales

SALES

Unit: KRW million

STEP 4

Cost / Value-Added Share

COST_RATIOS / VA_RATIOS

Unknown items = 0 → auto-estimated from industry ratios

3 calculation modes depending on input completeness

Case 1

Only sales known

Leaving all cost items at 0 applies the national-average industry structure for estimation

Case 2

Some cost items known

Enter known items only; the rest is auto-filled with national averages (example run)

Case 3

All costs known

Enter directly so that COST_RATIOS + VA_RATIOS sum to 100%

Calculation method is identical to the existing EEIO pipeline — Scope1 from sales × direct emission coefficient (B), Scope2 from the electricity-row correction of the M matrix ($\text{diag}(B) \cdot L$), and the remaining supply-chain induction as Scope3

4. GHG-Simulator

- SMEs and others, using KR-EEIO, estimate total emissions and Scope1, 2, 3

Chemical products(C05) For a company in the industry with sales of 1000, and cost shares of Wood, paper and printing (C03) 5%, Coal and petroleum products(C04) 10% entered

Company Information

Company Name	BOK Company
Industry	C05 Chemical products
Sales (KRW million)	1,000
Calculation Mode	Case2 (some costs known)

Carbon Emission Results — Scope 1 · 2 · 3

Scope1 (Direct emissions)	224.9 tCO2eq	42.1%
Scope2 (Electricity, etc. indirect emissions)	139.3 tCO2eq	26.1%
Scope3 (Other indirect emissions)	170.0 tCO2eq	31.8%
Total (Scope 1+2+3)	534.2 tCO2eq	100.0%

* Example input: COMPANY_CODE=C05, SALES=1,000 KRW million, only wood/petroleum-product costs partially entered (Case2)

Emission Contribution by Industry (Top 8)

1	Company analyzed	224.9	42.1%
2	D · Electricity, gas and steam	139.3	26.1%
3	C05 · Chemical products	81.3	15.2%
4	H · Transport services	36.1	6.8%
5	C04 · Coal and petroleum products	15.5	2.9%
6	E · Water · waste treatment · recycling	11.7	2.2%
7	C07 · Primary metal products	9.2	1.7%
8	C06 · Non-metallic mineral products	4.8	0.9%

5. Summary and Future Tasks

Summary

Methodology Summary

Calculated in four steps — domestic input coefficient(A_d) → Leontief inverse matrix(L_f) → emission coefficient(B) → supply-chain inducement coefficient(M) in 4 steps, with the electricity(D) sector separately corrected to split Scope 1/2/3.

Visualization and Output Summary

① Scope dashboard, ② B vs $B \times L$ grid time series, ③ GHG-Simulator result tables can all be viewed directly in the Model hub notebooks.

Notes

Price-Basis Dependency

Current prices are for practical calculations, while constant prices (2020=100) serve a different purpose — pure volume comparison across years.

Simulator Estimate Limitations

Unentered cost items are replaced with industry averages, so error can grow larger if the actual cost structure differs.

- KR-EEIO_result.ipynb
- KR-EEIO_Simulator.ipynb

5. Summary and Future Tasks

Future Tasks

Acquiring official data from Input-Output Team

Replacing current emission estimates with emission data to be officially estimated by the Input-Output Team

Incorporate Import Analysis

Add analysis of imported goods in addition to domestically produced goods (GHG emissions analysis by importing country using international industry-linkage tables, etc.)

Compile Based on Basic Prices

The current KR-EEIO, based on an industry-linkage table published in producer prices, KR-EEIO includes net taxes on products, so it should be compiled based on basic prices with each industry's tax effect removed — KR-EEIO compilation

Expand Sector Count & Environmental Statistics

-Expanded to the basic-sector level (380 industries) based on GHG emissions by energy source and other data, increasing KR-EEIO's utility

- 7 individual GHGs' emissions, energy, waste, and wastewater/water — by incorporating these and other environmental statistics, KR-EEIO's coverage will be progressively expanded

Thank You
